PrROCALTROL®
calcitriol

PART I: HEALTH PROFESSIONAL INFORMATION

SUMMARY PRODUCT INFORMATION

Route of Administration	Dosage Form / Strength	Clinically Relevant Nonmedicinal Ingredients
capsules	0.25 µg and 0.5 µg	Gelatin <i>For a complete listing see Dosage Forms, Composition and Packaging section.</i>

INDICATIONS AND CLINICAL USE

ROCALTROL (calcitriol) is indicated in the management of:

- Hypocalcemia and osteodystrophy in patients with chronic renal failure undergoing dialysis.
- Hypocalcemia and its clinical manifestations associated with:
 - Post-surgical hypoparathyroidism.
 - Idiopathic hypoparathyroidism.
 - Pseudohypoparathyroidism.
- Vitamin D resistant rickets (familial hypophosphatemia).

Geriatrics (>65 years of age): Limited data are available in patients 65 years of age or older. Caution should be used when treating elderly patients.

Pediatrics (<18 years of age): The safety and efficacy of calcitriol capsules in children have not been sufficiently investigated. Use is not recommended in this patient population.

CONTRAINDICATIONS

- Patients who are hypersensitive to this drug, vitamin D or its analogues and derivatives, or to any ingredient in the formulation. For a complete listing, see the DOSAGE FORMS, COMPOSITION AND PACKAGING section of the product monograph.
- Hypercalcemia or evidence of vitamin D overdose.

WARNINGS AND PRECAUTIONS

General

Since ROCALTROL (calcitriol) is a potent cholecalciferol derivative with profound effects on intestinal absorption of dietary calcium and inorganic phosphate, it should not be used concomitantly with other vitamin D products or its derivatives.

The desired therapeutic margin of ROCALTROL is narrow, therefore, the optimal daily dose must be carefully determined for each patient by dose titration to obtain satisfactory response in the biochemical parameters and clinical manifestations (see DOSAGE AND ADMINISTRATION section).

Cardiovascular

In patients on digitalis, hypercalcemia may precipitate cardiac arrhythmias; in such patients ROCALTROL should be used with extreme caution.

Carcinogenesis and mutagenesis

See TOXICOLOGY section

Endocrine and Metabolism

Chronic hypercalcemia can lead to generalized vascular calcification, nephrocalcinosis, calcifications of the cornea or other soft tissues. During treatment with ROCALTROL the serum total calcium (mg/dL) times serum inorganic phosphate product (Ca x P) should not exceed 70 mg²/dl².

Dialysate calcium level of 7 mg% or above in addition to excessive dietary calcium supplements may lead to frequent episodes of hypercalcemia.

Patients need to adhere to prescribed calcium intake, dietary and supplementary, and avoid unapproved non-prescription drugs or medications. Patients should also be made aware of the symptoms of hypercalcemia and should seek medical attention if such symptoms are noted (see ADVERSE REACTIONS).

Patients with vitamin D resistant rickets (familial hypophosphatemia) should pursue their oral phosphate therapy. However, the possible stimulation of intestinal phosphate absorption by ROCALTROL should be taken into account since this effect may modify the requirement for phosphate supplements (see DRUG INTERACTIONS).

Renal

In patients with normal renal function, chronic hypercalcemia may be associated with an increase in serum creatinine. While the elevation of serum creatinine is usually reversible, it is important in such patients to pay careful attention to those factors which may lead to hypercalcemia. ROCALTROL therapy should always be started at the lowest possible dose and increased with

careful monitoring of serum calcium concentrations. An estimate of daily dietary calcium intake should be made and the intake adjusted when indicated.

Patients taking ROCALTROL should avoid dehydration. Adequate fluid intake should be maintained.

Special Populations

Pregnant Women: The safety of ROCALTROL in women who are or may become pregnant has not been established; use of ROCALTROL in these cases may be considered only when the potential benefits have been weighed against possible hazards to mother and fetus.

Nursing Women: ROCALTROL may be excreted in human milk. In view of the potential for hypercalcemia in the mother and for adverse reactions from ROCALTROL in nursing infants, mothers may breastfeed while taking ROCALTROL, provided that the serum calcium levels of the mother and infant are monitored.

Geriatrics (>65 years of age): Limited data are available in patients 65 years of age or older. Caution should be used when treating elderly patients.

Pediatrics (<18 years of age): The safety and efficacy of calcitriol capsules in children have not been sufficiently investigated. Use is not recommended in this patient population.

Monitoring and Laboratory Tests

Serum calcium, inorganic phosphorus, magnesium, alkaline phosphatase as well as 24-hour urinary calcium and phosphorus should be determined periodically during maintenance therapy with ROCALTROL.

During the initial phase of the medication (dosage adjustment), serum calcium should be determined at least twice weekly. A fall in serum alkaline phosphatase values may indicate impending hypercalcemia. Should hypercalcemia develop, the drug should be discontinued immediately until the serum calcium level has normalized. This may take several days to a week.

Therapy with ROCALTROL should only be considered when adequate laboratory facilities for monitoring of blood and urine chemistries are available. During treatment progressive hypercalcemia either due to hyper-responsiveness or overdosage may become so severe as to require emergency treatment.

Periodic ophthalmological examinations and radiological evaluation of suspected anatomical regions for early detection of ectopic calcifications are advisable.

ADVERSE REACTIONS

Adverse Drug Reaction Overview

Hypersensitivity reactions (pruritis, rash, urticaria, and very rarely severe erythematous skin

disorders) may occur. The adverse effects of ROCALTROL (calcitriol) are similar to those encountered with excessive vitamin D intake.

The early signs and symptoms associated with vitamin D intoxication and hypercalcemia are weakness, headache, somnolence, nausea, cardiac arrhythmias, excessive thirst, vomiting, dry mouth, constipation, muscle pain, bone pain, metallic taste, abdominal pain or stomach ache. The late signs and symptoms are polyuria, polydipsia, urinary tract infections, anorexia, weight loss, nocturia, conjunctivitis (calcific), pancreatitis, photophobia, rhinorrhea, pruritus, hyperthermia, decreased libido, elevated BUN, elevated AST and/or ALT, albuminuria, hypercholesterolemia, ectopic calcification, hypertension, cardiac arrhythmias, and rarely, overt psychosis.

Clinical Trial Adverse Drug Reactions

Because clinical trials are conducted under very specific conditions the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse drug reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.

The following adverse reactions, based on clinical studies and post-market experience in various indications, have been reported in association with ROCALTROL treatment. Where data are derived from spontaneous reporting, no estimates of frequency can be made, and the frequencies are described as ‘not known’.

The most commonly reported adverse reaction was hypercalcemia (20-30%).

The ADRs listed in the table below are presented by system organ class and frequency categories, defined using the following convention: Very common ($\geq 1/10$); common ($\geq 1/100$ to $< 1/10$); uncommon ($\geq 1/1,000$ to $< 1/100$); rare ($\geq 1/10,000$ to $< 1/1,000$); very rare ($< 1/10,000$); not known (cannot be estimated from the available data). Within each frequency grouping, ADRs are presented in order of decreasing seriousness.

Table 1 Summary of ADRs Occurring in Patients Receiving ROCALTROL® (calcitriol)

System Organ Class	Very common	Common	Uncommon	Not known
Immune System Disorders				Hypersensitivity, Urticaria
Metabolism and Nutrition Disorders	Hypercalcaemia		Decreased appetite	Polydipsia, Dehydration
Psychiatric Disorders				Apathy Apprehension, Agitation, Insomnia

System Organ Class	Very common	Common	Uncommon	Not known
Nervous System Disorders		Headache		Muscular weakness, Sensory disturbance
Gastrointestinal Disorders		Abdominal pain, Nausea	Vomiting	Constipation, Upper abdominal pain
Skin and subcutaneous tissue disorders		Rash		Erythema, Pruritus
Musculoskeletal and Connective Tissue Disorders				Growth retardation, Extremity pain
Renal and Urinary Disorders		Urinary tract infection		Polyuria
General disorders and administration site conditions				Calcinosis, Pyrexia, Thirst
Investigations			Blood creatinine increased	Weight decreased

Abnormal Hematologic and Clinical Chemistry Findings

The following abnormal hematologic and clinical chemistry findings, based on clinical studies, have been reported in association with ROCALTROL treatment: Elevated alkaline phosphatase, hypercalciuria, hypermagnesemia, hyperphosphatemia, elevated lymphocytes, elevated hematocrit, elevated neutrophils, elevated hemoglobin, elevated AST and/or ALT.

DRUG INTERACTIONS

Overview

First step of calcitriol catabolism is catalyzed by CYP24A1 a specific cytochrome P450 isoenzyme. Known inducers of CYP2C8, 2C, 2C19 and CYP3A do not modulate the activity of CYP24A1.

Since ROCALTROL also has an effect on phosphate transport in the intestine, kidneys and bones, the dosage of phosphate-binding agents must be adjusted in accordance with the serum phosphate concentration (normal values: 2-5 mg/100 ml, or 0.65-1.62 mmol/l).

Drug-Drug Interactions:

Anticonvulsant: The co-administration of phenytoin or phenobarbital will not affect plasma concentrations of calcitriol, but may reduce endogenous plasma levels of 25(OH)D3 by inhibiting 25-hydroxylase in liver or increased CYP-mediated catabolism of 25(OH)D3. Higher

doses of ROCALTROL or Vitamin D supplementation may be necessary if anticonvulsants and ROCALTROL are co-administered together.

Cholestyramine, Sevelamer and Mineral oil: Intestinal absorption of ROCALTROL may be impaired by bile acid sequestrants including cholestyramine and sevelamer and by use of mineral oil as a laxative.

Digitalis: Hypercalcemia in patients on digitalis may precipitate cardiac arrhythmias.

Corticosteroids: A relationship of functional antagonism exists between vitamin D analogues, which promote calcium absorption, and corticosteroids, which inhibit calcium absorption.

Ketoconazole: Ketoconazole may inhibit both synthetic and catabolic enzymes of calcitriol. Reductions in serum endogenous calcitriol concentrations have been observed following the administration of 300 mg/day to 1200 mg/day ketoconazole for a week to healthy men. However, *in vivo* drug interaction studies of ketoconazole with ROCALTROL have not been investigated.

Thiazides: Thiazides are known to induce hypercalcemia by the reduction of calcium excretion in urine. The concomitant administration of thiazides with ROCALTROL may cause hypercalcemia. Therefore, precaution should be taken when co-administration is necessary.

Calcium Supplements: Dietary instructions, especially concerning calcium supplements, should be strictly observed, and uncontrolled intake of additional calcium-containing preparations avoided.

Magnesium: Magnesium-containing drugs (eg, antacids) may cause hypermagnesemia and should therefore not be taken during therapy with ROCALTROL by patients on chronic renal dialysis.

Drug-Food Interactions:

Interactions with food have not been established

Drug-Herb Interactions:

Interactions with herbal products have not been established

Drug-Laboratory Test Interactions:

Interactions with laboratory tests have not been established

DOSAGE AND ADMINISTRATION

Dosing Considerations

The optimal daily dose of ROCALTROL (calcitriol) must be carefully determined for each patient. The effectiveness of ROCALTROL therapy is predicated on the assumption that each patient is receiving an adequate daily intake of calcium.

Because of improved calcium absorption from the gastrointestinal tract, some patients on ROCALTROL may be maintained on a lower calcium intake or no supplementation at all.

Recommended Dose and Dosage Adjustment

Dialysis Patients:

Titration: The recommended initial dose of ROCALTROL is 0.25 µg/day. If a satisfactory response in the biochemical parameters and clinical manifestations of the disease state are not observed, dosage may be increased by 0.25 µg/day at two to four week intervals. During this titration period, serum calcium levels should be obtained at least twice weekly, and if hypercalcemia is noted, the drug should be immediately discontinued until normocalcemia ensues.

Maintenance: Patients with normal or only slightly reduced serum calcium levels may respond to ROCALTROL doses of 0.25 µg every other day. Most patients undergoing hemodialysis respond to dosages between 0.5 and 1 µg/day.

In order to decrease the risk of hypercalcemic episodes, a downward adjustment of the dose of ROCALTROL may be advisable once a reduction in serum alkaline phosphatase has been achieved.

Hypoparathyroidism and Vitamin D Resistant Rickets

The recommended initial dose of ROCALTROL is 0.25 µg/day. If a satisfactory response in the biochemical parameters and clinical manifestations of the disease are not observed, the dose may be increased by 0.25 µg/day at two to four-week intervals. During the dosage titration period, serum calcium levels should be measured at least twice weekly and, if hypercalcemia is present, ROCALTROL should be immediately discontinued until normocalcemia ensues. Consideration should also be given to lowering the calcium intake.

Malabsorption is occasionally noted in patients with hypoparathyroidism; hence, larger doses of ROCALTROL may be needed.

Geriatrics (>65 years of age): Limited data are available in patients 65 years of age or older. Caution should be used when treating elderly patients. No dosage adjustments are required (see WARNINGS AND PRECAUTIONS).

Pediatrics (<18 years of age): The safety and efficacy of calcitriol capsules in children have not been sufficiently investigated to enable dosing recommendations.

Missed Dose

Missed dose should be taken as soon as it is remembered. The missed dose should be skipped if it is almost time for the next scheduled dose. No extra medicine should be taken to make up the missed dose.

Administration

Intermittent (Pulse) Therapy:

Oral intermittent (pulse) therapy with ROCALTROL two or three times weekly has been shown to be effective even in patients refractory to continuous therapy. Serum calcium levels should be monitored during therapy.

OVERDOSAGE

Administration of ROCALTROL (calcitriol) to patients in excess of their daily requirements can cause hypercalcemia, hypercalciuria and hyperphosphatemia. Conversely, high intake of calcium and phosphate concomitantly with therapeutic doses of ROCALTROL may cause similar abnormalities. In dialysis patients, high levels of calcium in the dialysis bath may contribute to hypercalcemia. The serum calcium times phosphate (Ca x P) product should not be allowed to exceed $70\text{mg}^2/\text{dl}^2$.

Treatment of Hypercalcemia and Overdosage

General treatment of hypercalcemia (more than 1 mg/dL or 0.25 mmol/L above the upper limit of the normal range) or serum creatinine is more than 120 $\mu\text{mol/L}$, consists of immediate discontinuation of ROCALTROL therapy, institution of a low calcium diet and withdrawal of calcium supplements. Serum calcium and phosphate levels should be determined daily until normocalcemia ensues. Hypercalcemia frequently resolves in two to seven days. When serum calcium levels have returned to within normal limits, ROCALTROL therapy may be reinstated at a dose of 0.25 $\mu\text{g/day}$ less than prior therapy. Serum calcium levels should be carefully monitored (at least twice weekly) during this period of dosage adjustment and subsequent dosage titration. In dialysis patients, persistent or markedly elevated serum calcium levels may be corrected by dialysis against a calcium-free dialysate.

Treatment of Accidental Overdosage

The treatment of acute accidental overdosage with ROCALTROL should consist of general supportive measures. If drug ingestion is discovered within a relatively short time, induction of emesis or gastric lavage may be of benefit in preventing further absorption. If the drug has passed through the stomach, the administration of mineral oil may promote its fecal elimination. Serial serum electrolyte determinations (especially calcium ion) rate of urinary calcium excretion and assessment of electrocardiographic abnormalities due to hypercalcemia should be obtained. Such monitoring is critical in patients receiving digitalis. Discontinuation of supplemental calcium and low calcium diet are also indicated in accidental overdosage. Due to the relatively short pharmacological action of calcitriol, further measures are probably unnecessary. Should, however, persistent and markedly elevated serum calcium levels occur, there are a variety of therapeutic alternatives which may be considered, depending on the patient's underlying condition. These include the use of drugs such as phosphates and corticosteroids as well as measures to induce an appropriate forced diuresis. The use of peritoneal dialysis against a calcium free dialysate has also been reported.

For management of a suspected drug overdose, contact your regional Poison Control Centre.

ACTION AND CLINICAL PHARMACOLOGY

Mechanism of Action

ROCALTROL (calcitriol) is the most active known form of vitamin D₃ in stimulating intestinal calcium transport.

The supply of vitamin D in man depends on dietary intake and/or exposure to the ultraviolet rays of the sun for conversion of 7-dehydrocholesterol to vitamin D₃ (cholecalciferol). Vitamin D₃ must be metabolized in the liver and the kidney before it is fully active on its target tissues. The initial transformation is catalyzed by a vitamin D₃-25-hydroxylase enzyme (25-OHase) present in the liver, and the product of this reaction is 25-hydroxy-vitamin D₃ (25-OH-D₃). The latter undergoes hydroxylation in the mitochondria of kidney tissue. This reaction is activated by the renal 25-hydroxy-vitamin D₃ -1 alphahydroxylase (alpha-OHase) to produce 1,25-(OH)₂ D₃ (calcitriol).

Pharmacodynamics

The two known sites of action of calcitriol are intestine and bone, but additional evidence suggests that it also acts on the kidney and the parathyroid gland.

In acutely uremic rats calcitriol has been shown to stimulate calcium absorption. This agent also promotes the intestinal absorption of phosphorus through stimulation of an active transport system distinct from the calcium transport process.

Calcitriol stimulates bone resorption which serves to mobilize calcium for the circulation, when an intestinal source of calcium is absent. This effect is related to the role of vitamin D in maintaining the homeostasis of calcium and phosphorus in plasma. In addition, calcitriol may interact directly with osteoblasts.

The effects of calcitriol on the renal transport of calcium and phosphate appear to be influenced by the presence or absence of the parathyroid glands, vitamin D status, volume expansion and the dose of vitamin D metabolite used. With the available information it is not possible to determine which vitamin D metabolite, if any, influences divalent ion transport by the renal tubule under physiologic conditions or if so, whether an interaction with parathyroid hormone is required.

The presence of a direct negative feedback effect of calcitriol on the parathyroid gland has been suspected. Some investigators have postulated that calcitriol may exert a direct influence on the parathyroids. Although inhibition of PTH secretion by calcitriol has been demonstrated *in vitro*, the data obtained from *in vivo* studies is more equivocal.

Pharmacokinetics

Absorption: In human studies, calcitriol is rapidly absorbed from the intestine. After an oral

dose of tritiated calcitriol, the peak concentration of radioactivity in the serum was reached after 4 hours.

Distribution: Vitamin D metabolites are known to be transported in blood, bound to a specific alpha₂ globulin.

Metabolism: See ACTION AND CLINICAL PHARMACOLOGY, Mechanism of Action section.

Excretion: The half-life of calcitriol elimination from serum was found to range from 9 to 10 hours. However, the duration of pharmacologic activity of a single dose of calcitriol lasts about 3-5 days.

Special Populations and Conditions

Geriatric (>65 years of age): Studies characterizing the pharmacokinetics of calcitriol in geriatric patients have not been performed.

Pediatrics (<18 years of age): The safety and efficacy of calcitriol capsules in children have not been sufficiently investigated.

Gender: Controlled studies examining the influence of gender on calcitriol have not been conducted.

Hepatic Insufficiency: Controlled studies examining the influence of hepatic disease on calcitriol have not been conducted.

Renal Insufficiency: Controlled studies examining the influence of renal disease on calcitriol have not been conducted.

STORAGE AND STABILITY

Capsules should be stored at 15-25°C. Store in the original container. Protect from light and moisture. Keep blister in the outer carton.

DOSAGE FORMS, COMPOSITION AND PACKAGING

ROCALTROL (calcitriol) is supplied as follows:

Capsules 0.25 µg:	brown-orange to red-orange, opaque (first-half)/white to grey-yellow or grey-orange, opaque (second half) oval soft gelatin capsules. There are 20 capsules per blister card and 5 blister cards per carton, for a total of 100 capsules per unit.
-------------------	--

Capsules 0.50 µg: brown-orange to red-orange, opaque oval soft gelatin capsules. There are 20 capsules per blister card and 5 blister cards per carton, for a total of 100 capsules per unit.

Composition:

Capsules
(0.25 µg and 0.50 µg) : butylhydroxyanisole, butylhydroxytoluene, medium-chain triglycerides (fractionated coconut oil), gelatin, glycerol 85%, hydrogenated products of partially hydrolysed starch, titanium dioxide E 171, red and yellow iron oxide E172.

PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

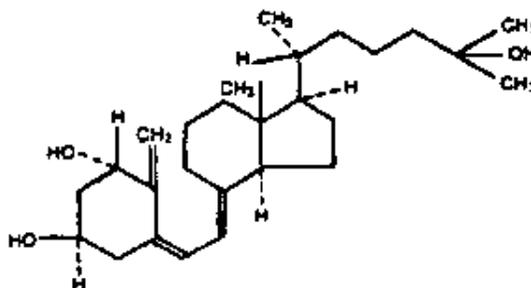

Drug Substance

Proper name: Calcitriol

Chemical name: $1\alpha,25$ -dihydroxycholecalciferol; (5Z,7E)-9, 10-secocholesta-5,7,10 (19)-triene- $1\alpha,3\beta$, 25-triol.

Molecular formula and molecular mass: $C_{27}H_{44}O_3$, , 416.65

Structural formula:

Physicochemical properties: Calcitriol is a practically white crystalline compound with a melting range of 111-115°C. It is soluble in organic solvents, but relatively insoluble in water.

CLINICAL TRIALS

Treatment with calcitriol does not affect serum magnesium levels which are already elevated in the majority of patients with severe chronic renal failure.

A number of recent reports have indicated that vitamin D analogues may cause a deterioration of renal function in chronic renal failure patients who are not on renal dialysis. One controlled study was conducted in 18 non-dialysed patients with creatinine clearances of less than 35 mL/min and mild osteodystrophy, who received daily doses of approximately 4,000 I.U. of vitamin D₃ or 0.25 - 1.0 µg of calcitriol for 6 months. Results indicated that the percentage fall in creatinine clearance was greater during treatment than during the preceding 6 months in all patients receiving calcitriol and in 7 out of 9 patients on vitamin D₃. Therefore, before vitamin D

analogues are used prophylactically, additional trials are necessary to show whether the benefits outweigh any hazard that may emerge.

DETAILED PHARMACOLOGY

The relative biological activity between the parent vitamin D₃ and its metabolites is summarized in Table 1. Most studies of vitamin D metabolism have utilized naturally occurring cholecalciferol or vitamin D₃, as the comparison standard.

Table 2 Relative Biological Effectiveness of Vitamin D₃, 25-OH-D₃ and Calcitriol

Biological response	species	vitamin D ₃	Relative activity*	
			25-OH-D ₃	Calcitriol
Intestinal Ca²⁺ transport	Chick	1.0	2.0	13
Bone Ca²⁺ mobilization	Chick	1.0	1.5	5-6
Rat line test	Chick	1.0	1.5	2-3
Percent bone ash	Chick	1.0	1.6	2
	Chick	1.0	-	7-8
Body growth	Chick	1.0	1.0	5

** In each instance the response obtained with vitamin D₃ was set equal to 1.0 and the responses obtained from an equal molar quantity of the other vitamin D₃ metabolites calculated accordingly.*

A single dose of calcitriol was administered orally to chicks. It was found to be at least 13 times as effective as D₃ in stimulating the intestinal absorption of calcium and 5 to 6 times as effective as D₃ in elevating the serum calcium level (bone calcium mobilization). In experiments where calcitriol was administered daily to chickens and rats it was equally, if not more, active than vitamin D₃ bone ash, serum calcium levels and rate of growth tests.

In the intestinal cell, calcitriol and its cytoplasmic protein receptor become bound to the chromatin fraction of the cell nucleus. Thus, calcitriol directs the synthesis of new proteins or alters membrane structure in such a way as to facilitate the transcellular movement of calcium. Calcitriol also promotes resorption of bone and leads to calcium mobilization. The mechanism by which calcitriol produces mineralization of osteoids in the skeleton is uncertain but it is known that calcitriol becomes localized in the nuclei of bone cells. The mechanism whereby calcitriol acts on the kidney and parathyroid gland is obscure. It is believed that calcitriol may enhance the tubular reabsorption of calcium and phosphate. It may also have a negative feedback effect on the secretion of PTH by the parathyroid gland.

TOXICOLOGY

Acute Toxicity

Acute LD₅₀ studies have been performed on both mice and rats.

Acute toxicity studies in mice and rats indicated that the approximate oral lethal dose of calcitriol ranged from 1.35 to 3.9 mg/kg. These values are several orders of magnitude higher than the proposed clinical dose of 0.25 µg twice daily (approximately 8-10 ng/kg/day).

Species	Route	LD ₅₀ Calcitriol mg/kg
Mice	p.o.	2.0
	i.p.	1.0
	s.c.	0.5
	i.v.	1.6
Rats	p.o.	> 5.0

Calcitriol (100 µg/mL) was administered intramuscularly to rabbits. Volumes of 0.1 and 1.0 mL produced only very slight irritation (minor hemorrhage and necrosis). No hemolysis was produced following an intravenous injection of 0.2 mL/kg (20 µg) in dogs, and no evidence of venous irritation was found 24 hours after injection.

Chronic Toxicity

Rats

Charles River CD rats received calcitriol by oral intubation daily for 26 weeks at dose levels of 0 (vehicle only), 0.02, 0.08 and 0.30 µg/kg. A 5th group was sham intubated daily.

All rats were observed daily for signs of toxicity. Dose related changes occurred in groups receiving calcitriol. Reduction in body weight and food consumption, increased serum calcium, as well as slight changes other clinical chemistry values and organ weights were noted in the high and mid-dose groups; these were either absent or less extensive in the low-dose group. Histologic examination of tissues from rats of all groups given calcitriol revealed calcification in kidney tubules and cardiac myofibers, as well as bone changes; in the low-dose group the changes consisted only of focal calcification and less severe bone changes. The bone changes in rats of the high-dose group consisted of alterations of the epiphyseal plate with disorganization of chondrocytes and evidence of bone resorption; there was thickening of the periosteum due to increased connective tissue.

Dogs

Calcitriol was administered orally to beagle dogs (6 dogs/group) at daily doses of 0 (vehicle only), 0.02 and 0.08 µg/kg for 26 weeks. A 0.30 µg/kg dosage was also included at the beginning of the study but had to be discontinued because of toxicity after 39 days.

Two dogs of the 0.30 µg/kg/day group were sacrificed after 39 days and the remaining 4 dogs were observed for an additional 21 weeks. In these dogs, body weight loss slowly reversed and general condition improved but clinical laboratory measurements did not completely regress and soft tissue calcification was noted at autopsy. Two of the 6 dogs of the 0.08 µg/kg/day group died. Marked anorexia, severe weight loss, deterioration of physical condition, increased serum calcium and urea nitrogen, as well as other alterations in clinical laboratory measurements, calcification of soft tissue, bone resorption with replacement by fibrous tissue and irregular calcium deposits in the epiphyseal cartilage plates were observed in the high and mid-dose group.

In the low-dose group (0.02 µg/kg/day) inconsistent alterations in clinical laboratory measurements and pathological changes of limited extent were observed. Histopathologic changes in low-dose dogs were limited to a single calcified focus in the kidney of 1 dog, a calcified urinary bladder artery in a second and a slight bone abnormality in a third animal.

Subchronic toxicity studies in rats and dogs indicated that calcitriol at an oral dose of 20 ng/kg/day (twice daily the usual human dosage) for up to 6 months produced no or minimal adverse effects. A dose of 80 ng/kg/day (8 times the usual human dosage) for up to 6 months produced moderate adverse effects; changes seen appeared to be primarily the result of prolonged hypercalcemia.

Reproductive Studies

Fertility and General Reproductive Performance

Calcitriol was administered orally to rats at dose levels of 0, 0.02, 0.08 and 0.30 µg/kg/day. No adverse effects on fertility, implantation, length of gestation, litter size, viability or lactation indices were noted in rat reproduction studies in which males were pretreated for 61 days and females for 14 days prior to mating and through sacrifice on either day 13 of gestation or through lactation day 21. Treatment of females resulted in a statistically significant greater weight gain. One pup from the 0.30 µg/kg/day group appeared jaundiced. In the clinical laboratory measurements, increased serum calcium levels in the 0.30 µg/kg dams, decreased serum phosphate levels in the 0.08 µg/kg dams and increased blood urea nitrogen in the 0.02 µg/kg pups were statistically significant.

Teratology

Calcitriol was administered orally to rabbits and rats at dose levels of 0, 0.02, 0.08 and 0.30 µg/kg/day. Rabbits treated with 0.30 µg/kg/day from day 7 through day 18 of gestation exhibited marked weight loss. Three of these fifteen animals died, two exhibiting tissue lesions suggestive of hypervitaminosis D. In the 0.30 µg/kg/day group there was also a decreased litter size, an increased resorption rate, reduced fetal body weight and viability index, as well as increased neonatal mortality during the first postnatal day. Two litters of the 0.3 µg/kg/day (7 fetuses) and one at the 0.08 µg/kg/day (9 fetuses) dose levels had multiple external malformations, accompanied by skeletal visceral abnormalities. These anomalies (16/177 fetuses) occurred at doses 4 to 15 times the dose recommended for human use.

In the rat, pregnant females were intubated from day 7 through day 15 of gestation. Maternal weight gain and average number of implantation sites were slightly reduced in the 0.30 µg/kg/day group. A small number of isolated fetal abnormalities were seen in all groups. However, no significant differences were observed in the frequency and nature of abnormalities or skeletal variations between control and treated groups.

Perinatal and Postnatal Studies

Calcitriol was administered orally to rats at dose levels of 0, 0.02, 0.08, 0.30 µg/kg/day. No adverse effects on average litter size, viability and lactation indices were noted in litters from female rats treated from day 15 of gestation through day 21 of lactation. One female of the 0.08 µg/kg/day group became moribund and had to be sacrificed prior to delivery, a second had a mammary tumor, and 1 female of the 0.30 µg/kg/day group had urinary calculi. Dams at 0.08 and 0.30 µg/kg/day exhibited hypercalcemia and hypophosphatemia. Elevated blood urea nitrogens were noted only at 0.30 µg/kg/day dose. Only elevated serum calcium was found in pups at 0.08 and 0.30 µg/kg, and a slight elevation in bone ash only at 0.30 µg/kg.

Mutagenicity

There was no evidence of mutagenicity as studied by the Ames Method.

PART III: CONSUMER INFORMATION**Pr** **ROCALTROL**[®]
calcitriol

This leaflet is part III of a three-part "Product Monograph" published for ROCALTROL and is designed specifically for Consumers. This leaflet is a summary and will not tell you everything about ROCALTROL. Contact your doctor or pharmacist if you have any questions about the drug.

ABOUT THIS MEDICATION**What the medication is used for:**

ROCALTROL is indicated in the management of

- Calcium deficiency (hypocalcemia) and bone disease in patients with chronic renal failure undergoing dialysis
- Calcium deficiency (hypocalcemia) in patients with hypoparathyroidism (underactive parathyroid glands).
- Rickets (type of bone disease).

What it does:

ROCALTROL helps patients with kidney or bone disease (eg. rickets) who cannot make enough of the active form of vitamin D in the body to meet their needs. ROCALTROL supplies this form of vitamin D which the body can use to meet requirements.

When it should not be used:

- If you are allergic to the medicinal ingredient calcitriol, vitamin D, other vitamin D products or other forms of vitamin D or to any of the nonmedicinal ingredients in this formulation (see **What the non-medicinal ingredients are**).
- If you have hypercalcemia (high levels of calcium in the blood).

What the medicinal ingredient is:
calcitriol**What the important non-medicinal ingredients are:**

butylhydroxyanisole, butylhydroxytoluene, medium-chain triglycerides (fractionated coconut oil), gelatin, glycerol 85%, hydrogenated products of partially hydrolysed starch, red and yellow iron oxide E172, titanium dioxide E171.

What dosage forms it comes in:

Capsules 0.25 µg: brown-orange to red-orange, opaque (first-half)/white to grey-yellow or grey-orange, opaque (second half) oval soft gelatin capsules.

Capsules 0.50 µg: brown-orange to red-orange, opaque oval soft gelatin capsules.

WARNINGS AND PRECAUTIONS

BEFORE you use ROCALTROL talk to your doctor or pharmacist if:

- you are allergic to vitamin D or other forms of vitamin D products or to any ingredient of ROCALTROL.
- you have a history of kidney disease.

- you are undergoing dialysis.
- you have a history of heart disease.
- you are using cardiac glycosides (eg. digitalis).
- you are pregnant or planning to become pregnant during treatment.
- you are breastfeeding or planning to breastfeed. ROCALTROL may be released in human breast milk. Discuss with your doctor.
- you are taking any other drugs including non-prescription drugs, other vitamin D products, or other forms of vitamin D or any other vitamins or supplements.

INTERACTIONS WITH THIS MEDICATION

Drugs that may interact with ROCALTROL include: digitalis, bile acid sequestrants (including cholestyramine and sevelamer) and mineral oil, anticonvulsants (e.g. phenytoin, phenobarbital), calcium supplements, corticosteroids, ketoconazole, magnesium-containing drugs (e.g. some antacids), thiazides.

PROPER USE OF THIS MEDICATION

The effectiveness of ROCALTROL therapy is based on the assumption that each patient is receiving an adequate daily intake of calcium.

To ensure that you receive an adequate daily intake of calcium, your doctor may either prescribe a calcium supplement or instruct appropriate dietary measures. Your doctor may monitor your blood levels of calcium and phosphorus.

Be sure to drink plenty of fluids to maintain good hydration, important during ROCALTROL treatment.

Usual adult dose:

Dosage is based on your medical condition and response to therapy. Your doctor may start you on a low dose and adjust the dose slowly to find the best dose for you. Follow your doctor's directions carefully.

Missed Dose

Take your missed dose as soon as you remember. Skip taking the missed dose if it is almost time for the next scheduled dose. No extra medicine should be taken to make up the missed dose.

Overdose:

In case of drug overdose, contact a health care practitioner, hospital emergency department or regional Poison Control Centre immediately, even if there are no symptoms.

SIDE EFFECTS AND WHAT TO DO ABOUT THEM

The most common side effect of ROCALTROL is hypercalcemia -high calcium levels in the blood (see Serious Side Effects table below for symptoms). Common side effects include nausea, vomiting, stomach cramps, itching and sleeplessness.

Other side effects include agitation, sleeplessness, lack of feeling, weakness, constipation, upper abdominal pain, redness or itching

of the skin, excessive thirst, fever and joint pain. If these side effects become bothersome or persist, contact your doctor.

SERIOUS SIDE EFFECTS, HOW OFTEN THEY HAPPEN AND WHAT TO DO ABOUT THEM				
Symptom / effect		Talk with your doctor or pharmacist		Stop taking drug and call your doctor or pharmacist
		Only if severe	In all cases	
Very common	<p>Higher blood calcium levels than normal.</p> <p>Possible symptoms:</p> <p><i>Early symptoms:</i> weakness, headache, drowsiness, nausea, irregular heartbeat, excessive thirst, vomiting, dry mouth, constipation, muscle pain, bone pain, metallic taste, abdominal pain or stomach ache.</p> <p><i>Late symptoms:</i> frequent urination (including needing to urinate at night), excessive thirst, urinary tract infections, anorexia, weight loss, conjunctivitis, inflammation of the pancreas, sensitivity to light, runny nose, itching, feeling feverish, decreased sex drive, too much protein in the urine, high cholesterol, elevated liver function tests, excessive calcium in tissues, high blood pressure, irregular heartbeat, and rarely, loss of contact with reality.</p>		√	

SERIOUS SIDE EFFECTS, HOW OFTEN THEY HAPPEN AND WHAT TO DO ABOUT THEM				
Symptom / effect		Talk with your doctor or pharmacist		Stop taking drug and call your
Common	Headache Abdominal pain - Rash Urinary tract infection		√	
Uncommon	Decreased appetite Vomiting		√	
Not known	<p>Allergic reactions - Possible symptoms: hives, difficulty breathing, swelling of your face, lips, tongue, or throat.</p> <p>Difficulty in understanding Growth retardation Excessive urination Calcium deposits on the skin Weight loss</p>		√	√

This is not a complete list of side effects. For any unexpected effects while taking, ROCALTROL contact your doctor or pharmacist.

HOW TO STORE IT

Capsules should be stored a 15-25°C. Store in the original container. Protect from light and moisture. Keep blister in the outer carton. Keep out of sight and reach of children.

REPORTING SUSPECTED SIDE EFFECTS

You can report any suspected adverse reactions associated with the use of health products to the Canada Vigilance Program by one of the following 3 ways:

- Report online at www.healthcanada.gc.ca/medeffect
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and:
 - Fax toll-free to 1-866-678-6789, or
 - Mail to: Canada Vigilance Program
Health Canada
Postal Locator 0701E
Ottawa, Ontario
K1A 0K9

Postage paid labels, Canada Vigilance Reporting Form and the adverse reaction reporting guidelines are available on the MedEffect™ Canada Web site at www.healthcanada.gc.ca/medeffect.

NOTE: Should you require information related to the management of side effects, contact your health professional. The Canada Vigilance Program does not provide medical advice.
