

**Health Canada Endorsed Important Prescribing Information on
TAMIFLU® (oseltamivir phosphate) suspension**

October 13, 2009

**Subject: Important information about risk of dosing error for TAMIFLU®
(oseltamivir phosphate) Powder for Oral Suspension (12 mg/mL)**

Dear Health Care Professional,

Hoffmann-La Roche Limited, in consultation with Health Canada would like to inform you of important dosing and administration information regarding the use of TAMIFLU® (oseltamivir phosphate) Powder for Oral Suspension.

TAMIFLU is a viral neuraminidase inhibitor authorized for sale in Canada for use in the treatment and prevention of uncomplicated acute illness due to influenza infection in adults and children above the age of 1 who have been symptomatic for no more than 2 days or have come in close contact with an infected individual (the index case). Health Canada has also issued an Interim Order (1) in July 2009 expanding use of Tamiflu as a treatment or prophylaxis for children less than 1 year of age for infection caused by the pandemic H1N1 2009 virus.

Healthcare Providers should note the following information regarding the use of TAMIFLU:

- **When dispensing commercially manufactured TAMIFLU Powder for Oral Suspension (12 mg/mL), pharmacists should ensure that the units of measure on the prescription instructions match the dosing device provided (e.g. a device graduated in mg for a prescription in mg).**
- **In Canada, the oral dosing dispenser provided with TAMIFLU Powder for Oral Suspension is marked with 30 mg, 45 mg, and 60 mg graduations, rather than graduations in milliliters (mL) or teaspoons (tsp). The recommended dosing instructions for adults and children are also provided in milligrams.**

There have been reported cases, in the US, where the units of measure in the instructions on the pharmacy prescription label were provided in milliliters (mL) or teaspoons, while the dosing device provided with the prescription was graduated in milligrams (mg). This has led to patient or caregiver confusion and dosing errors.

There have been no reports in Canada suggesting dosing errors associated with the use of TAMIFLU Powder for Oral Suspension.

When dispensing commercially manufactured TAMIFLU Powder for Oral Suspension (12 mg/mL), pharmacists should ensure the units of measure on the prescription instructions match the dosing device.

- If prescription instructions specify administration using milligrams (mg), as per the approved dosing recommendations, then the oral dosing dispenser included in the TAMIFLU product package should be provided to patients and the pharmacy prescription label should provide dosing instructions in milligrams (mg).

- If prescription instructions specify administration using milliliters (mL) or teaspoons (tsp), then the oral dosing dispenser included in the TAMIFLU product package should be removed and replaced with an appropriate measuring device, such as an oral syringe

Currently, the supply of TAMIFLU Powder for Oral Suspension is very limited and will continue to be so throughout this year. We would like to remind you that should the oral suspension not be readily available, the package insert provides guidance for emergency compounding of capsules to produce liquid suspensions (15 mg/mL) for administration to children or adults with difficulty swallowing capsules. **Note: This compounding procedure results in a 15 mg/mL suspension, which is different from the commercially available TAMIFLU for Oral Suspension, which has a concentration of 12 mg/mL.**

Dose recommendations according to the TAMIFLU Canadian product monograph (2) for patients greater than 1 year of age and the Health Canada Interim Order (1,3) dosing instructions for patients less than 1 year of age are summarized in the tables below. Please note that the last column in the tables refers to the commercially available oral suspension, and not the one obtained after compounding. A compounded suspension will have a different concentration and a different final volume.

Table 1: **Treatment** of influenza – Each dose is given twice daily for 5 days

In patients 1 year of age or older			
Body Weight in kg	Body Weight in lbs	Recommended Dose for 5 days	Quantity of TAMIFLU for Oral Suspension to Withdraw for Each Dose
≤15 kg	≤33 lbs	30 mg twice daily	2.5 mL
> 15 kg to 23 kg	> 33 lbs to 51 lbs	45 mg twice daily	3.8 mL
> 23 kg to 40 kg	> 51 lbs to 88 lbs	60 mg twice daily	5.0 mL
> 40 kg	> 88 lbs	75 mg twice daily	6.2 mL
In patient less than 1 year of age			
Based on weight (recommended): 2 mg / kg BID x 5 days			
If weight is not available:			
0 - < 3 months	12 mg twice daily for 5 days		
3 - < 6 months	20 mg twice daily for 5 days		
6 - < 12 months	25 mg twice daily for 5 days		

Table 2: **Prophylaxis** of influenza – Each dose is given once a day for 10 days.

In patients 1 year of age or older			
Body Weight in kg	Body Weight in lbs	Recommended Dose for at least 10 days	Quantity of TAMIFLU for Oral Suspension to Withdraw for Each Dose
≤15 kg	≤33 lbs	30 mg once daily	2.5 mL
> 15 kg to 23 kg	> 33 lbs to 51 lbs	45 mg once daily	3.8 mL
> 23 kg to 40 kg	> 51 lbs to 88 lbs	60 mg once daily	5.0 mL
> 40 kg	> 88 lbs	75 mg once daily	6.2 mL
In patient less than 1 year of age			
Based on weight (recommended): 2 mg / kg once a day x 10 days			
If weight is not available:			
0 - < 3 months	Not recommended for use at this time		
3 - < 6 months	20 mg once a day x 10 days		
6 - < 12 months	25 mg once a day x 10 days		

We encourage you to become familiar with these dosing instructions. For additional information regarding compounding from capsules as well as emergency compounding, please refer to the product monograph (2). Should you have any questions or require additional information regarding the use of TAMIFLU, please contact the Drug Information Department at Hoffman-LaRoche Limited at 1-888-762-4388 from 8:30 a.m. to 4:30 p.m. Monday to Friday Eastern Standard Time.

Managing marketed health product-related adverse reactions depends on health care professionals and consumers reporting them. Reporting rates determined on the basis of spontaneously reported postmarketing adverse reactions are generally presumed to underestimate the risks associated with health product treatments. Any case of serious or unexpected adverse reactions in patients receiving TAMIFLU® Tablets and Oral Solution should be reported to Hoffmann-La Roche Limited or Health Canada at the following addresses:

Hoffmann-La Roche Limited
 Drug Safety Department
 2455 Meadowpine Boulevard
 Mississauga, Ontario, L5N 6L7
 or call toll free at: 1-888-762-4388
 or Fax at: 905-542-5864
 or email to: mississauga.drug_safety@roche.com

Any suspected adverse reaction can also be reported to:

Canada Vigilance Program
